PROJECT KPIs

Olist E-Commerce Sales & Customer Experience Analytics

Team: InsightHub | Four dashboard workstreams

1. Purpose

This document defines how the team will measure project delivery quality and whether the analytical report is reliable, usable, and traceable to the Olist dataset. These are project-success KPIs, not the e-commerce business metrics that will appear in the dashboards. Targets below are proposed team targets and should be confirmed by the team/instructor.

2. Project Success KPIs

KPI	Definition / calculation	Proposed target	Evidence / measurement method	Review point
Required documentation completion	Number of required documentation artifacts completed and reviewed ÷ total required artifacts × 100%. Track planning, literature review, and requirements documents separately.	100% by each applicable DEPI milestone	GitHub checklist showing artifact, owner, status, reviewer, and file path.	Each milestone
Dashboard coverage	Number of the four dashboards completed and reviewed against their approved business questions.	4 of 4 dashboards	Question-to-visual checklist and review sign-off for each page.	Design and implementation
Business-question traceability	Approved questions mapped to valid dataset fields, a defined measure, and at least one appropriate visual.	100% of published questions mapped	Question-to-field-to-measure-to-visual mapping sheet.	Before finalizing each page
KPI validation coverage	Published numeric measures tested against source-level or independently calculated checks.	100% of headline KPIs checked	Reconciliation log with expected value, report value, filter context, and result.	Before release
Data-model integrity	Critical relationships and table-grain assumptions documented and tested for unexpected duplication or filter behavior.	All critical relationships reviewed; no unresolved critical duplication issue	Model diagram, relationship checklist, and sample-order tests.	Model review and QA
Interactive-control test pass rate	Passed slicer, cross-filter, drill-through (if used), and navigation tests ÷ total tests executed × 100%.	At least 95%; all critical interactions pass	Interaction test log with test case, expected result, actual result, and status.	QA and final review
Evidence-backed findings	Final insights include a supporting visual/metric and a stated limitation where relevant.	100% of final claims traceable to report evidence	Insight-to-visual reference and peer-review checklist.	Final report
On-time milestone delivery	Milestones delivered on or before the agreed official/program or team deadline.	Meet all required DEPI milestones	Project plan status and GitHub commit/file history.	Each milestone
Peer-review completion	Each dashboard reviewed by at least one other team member, with feedback recorded and resolved or acknowledged.	4 of 4 dashboards peer-reviewed	Review checklist and issue/fix log.	Before final submission

3. Dashboard Business Metrics — Separate from Project KPIs

The following are candidate e-commerce measures for the report, not project-management success KPIs. They should be finalized after data profiling and the team's KPI-definition review.

Dashboard area	Candidate metric	Definition / caution
Executive Sales & Orders	Distinct orders; item sales value; order-item count; freight value; average item sales value per order	Item sales value is sum of order-item prices, not profit or necessarily payment revenue. Define order-status inclusion and grain.
Product & Category	Category/product item sales value; order-item volume; freight-to-item-sales ratio where meaningful	Do not label item sales value as profit. Check missing category/attributes and compare freight only under a clear denominator.
Customer Experience & Delivery	Review-score distribution; delivered-order duration; late-delivery rate among eligible delivered orders	Specify score grouping and date eligibility; do not classify undelivered/canceled orders as delivered on-time/late.
Seller & Payment	Seller item sales value/order-item count; payment type mix; installment distribution; payment value	Payment table may contain multiple records per order. Avoid joins that duplicate payment or item totals.

4. Measurement and Review Rules

- Each KPI must have a written definition, owner, data source, calculation rule, and test evidence.
- Targets are proposed quality targets, not achieved results; record actual status only after testing.
- Use the same definition of a shared metric across all four dashboard pages.
- Recalculate or re-test a KPI when its definition, model relationship, or filter logic changes.
- Report failures and limitations honestly; do not alter targets after the fact just to make a result pass.

5. Approval

The four-person InsightHub team should review and approve these proposed targets, assign an owner for each KPI, and record any agreed changes. Dashboard business metrics should be validated separately from project-success KPIs.
